

KABA Cylinder Care & Maintenance Guide

KABA Cylinder Maintenance Guide

Regular Maintenance:

The benefit of regular maintenance of a locking system is generally underestimated, even though essential for continuous functioning of each locking mechanism. Regular and preventative maintenance with KABA cleaner spray has been specially developed for the cleaning and maintenance of cylinder locks and for the protection against corrosion.

- Decades of practical experience.
- Physical characteristics laboratory tested.
- Low viscosity point, can be used in low temperatures.
- Long lasting lubrication film, no thickening.
- Silicon-free.
- Barium-free.
- Extraordinary corrosion resistance for steel, nickel & brass.
- Suitable for all KABA and GEGE products.
- Also works well for mechatronic products.
- Three sizes available, 60ml & 200ml.
- 60ml cans are pump spray (no gas aerosol).

Benefits:

- Cleans and protects against corrosion.
- Prevents accumulated residue inside the key slot and on keys.
- Prevents premature wear and tear of the cylinder.
- Regular cleaning maintains the functionality of the KABA cylinder for longer.
- Easy to use.
- Environmentally friendly.

Strongly Recommended:

Never use other lubricants, for instance graphite, grease or oil and any other cleaning spray or agent containing oily substances in a KABA cylinder. These will encourage the accumulation of residue that in turn will achieve nothing more than the opposite - namely the creation of the equivalent of a grinding paste thus impairing the function and life of the cylinder.
